

Building a CWD summary

This program builds a data table, transfers it to Excel, and then creates a pivot table frame using that data table. The initial pivot table uses decay class as column headers, plot number and species as row labels, and volume/ha and the count of pieces/ha as values. The fields that the user selected in the options will appear as options that the user can select and drag into the pivot table as labels, values or filters.

The results are an interactive summary that allows you to explore the data.
