

# Installing VPro 19

---

VPro 19 comes as a complete package of everything you need to get started. Unlike some other programs, VPro 19 is a database front-end that does not require a setup executable file. Simply download the current VPro 19 zip file and unzip it in a location of your choice. Although it can be installed on a remote or network drive, VPro is happiest when located on a local drive.

## System Requirements

VPro is fairly flexible but does need proper resources. We usually try to target one Microsoft Office system in particular and allow for installation on a previous Office version and often on the next version of Office. For our target system with this version of VPro we looked at the most common system in use by users and that was Windows 10 and Office Pro 2010. That said, it should run on systems with Windows 7 and Office 2013, 2016 and 2019.

## Other Requirements

Some of the features of VPro, such as the hierarchy, require controls to add and edit data. These controls are found on most machines but we do occasionally find systems without the “Microsoft Windows Common Controls 6.0” installed. If that is the case on your machine, you may need to ask your system admin to add and activate the “MSCOMCTL.OCX” file.

## Starting VPro 19

Once you’ve unzipped the file you need to start the program by double clicking the “VPro19.accdb” file. It is probably easiest to create a shortcut to this file.
